TOSHIBA Bipolar Linear Integrated Circuit   Silicon Monolithic

TA8215H,TA8215L

18W BTL x 2CH Audio Power Amplifier

The thermal resistance θj−T of TA8215H and TA8215L package designed for low thermal resistance, has a high efficiency of heat radiation.
The temperature rise of chip can be reduced, and the influence from the degradation of the features due to the temperature rise at the high output can also be reduced.

This stereo audio power IC, designed for car audio use, has two built−in channels to reduce the characteristic difference between L and R channels.

In addition, the functions of stand−by and muting, and a variety of protection circuits are involved.

TA8215H

HZIP17-P-2.00

TA8215L

HSIP17-P-2.00

Weight
HZIP17−P−2.00 : 9.8g (typ.)
HSIP17−P−2.00 : 9.8g (typ.)

Features

- High power
  - : P_{OUT} (1) = 18W (typ.) / channel
    (V_{CC} = 14.4V, f = 1kHz, THD = 10%, R_L = 4Ω)
  - : P_{OUT} (2) = 15W (typ.) / channel
    (V_{CC} = 13.2V, f = 1kHz, THD = 10%, R_L = 4Ω)
- Low distortion ratio
  - : THD = 0.04% (typ.)
    (V_{CC} = 13.2V, f = 1kHz, P_{OUT} = 1W, R_L = 4Ω, G_V = 50dB)
- Low noise
  - : V_{NO} = 0.30mV$_{rms}$ (typ.)
    (V_{CC} = 13.2V, R_L = 4Ω, G_V 50dB, R_g = 0Ω, BW = 20Hz~20kHz)
- Built−in stand−by function (with pin (4) set at low, power is turned off.)
  - : I_{SB} = 1μA (typ.)
- Built−in muting function (with pin (1) set at low, power is turned off.)
  - : $V_{(mute)}$ = 1V (typ.)
- Built−in various protection circuits
  - Protection circuits：Thermal shut down, Over voltage, Out→V_{CC} short, Out→GND short and Out−Out short.
- Operating supply voltage：V_{CC} = 9~18V

Cautions And Application Method
(description is made only on the single channel.)

1. Voltage gain adjustment

Amp1 : Pre-Amp
Amp2 : Phase Amp
Amp3 : Power Amp (Flat-Amp)
Amp4 : Power Amp (Flat-Amp)

Fig. 1

This IC has the amplifier construction as shown in Fig.1. The Pre–Amp Amp1 is provided to the primary stage, and the input voltage is amplified by the Flat Amps, Amp3 and Amp4 of each channel through the phase Amp. (Amp2) .
Since the input offset is prevented by Pre–Amp when V_{CC} is set to on, this circuit can remarkably reduce the pop noise.

The total closed loop gain G_V of this IC can be obtained by expression below when the closed loop voltage gain of Amp1 is G_{V1}.

$$G_{V1} = 20\log \frac{R1 + (R_f + R2)}{R_f + R2} \ \ (dB) \ \ \ ..... \ \ (1)$$

The closed loop voltage gain of power Amp, Amp3 and Amp4 is fixed at $G_{V3} \fallingdotseq G_{V4} = 20dB$. Therefore, the total closed loop voltage gain G_V is obtained through BTL connection by the expression below.

$$G_V = G_{V1} + G_{V3} + 6 \ (dB) \ \ \ ..... \ \ (2)$$

For example, when $R_f = 0\Omega$, G_V is obtained by the expressions (1) and (2) as shown below.

$$G_V \fallingdotseq 24 + 20 + 6 = 50dB$$

The voltage gain is reduced when R_f is increased. (Fig.2)
With the voltage gain reduced, since (1) the oscillation stability is reduced, and (2) the pop noise changes when V_{CC} is set to on, refer to the items 3 and 4.

Fig. 2

2. Stand–by SW function

By means of controlling pin (4) (stand–by terminal) to high and low, the power suply can be set to on and off. The threshold voltage of pin (4) is set at about 3V (typ.), and the power supply current is about 1μA (typ.) at the stand–by state.

(4) pin control voltage : $V_{(SB)}$

| Stand–by	Power	$V_{(SB)}$ (V)
On	Off	0~2
Off	On	3~V_{CC}

Fig. 3 With Pin(4) Set to High, Power is Turned ON.

~Advantage of stand–by SW~
(1) Since V_{CC} can directly be controlled to on, off by the microcomuter, the switching relay can be omitted.
(2) Since the control current is microscopic, the switching relay of small current capacity is satisfactory for switching.

(Conventional Method)

(Standby Switch Method)
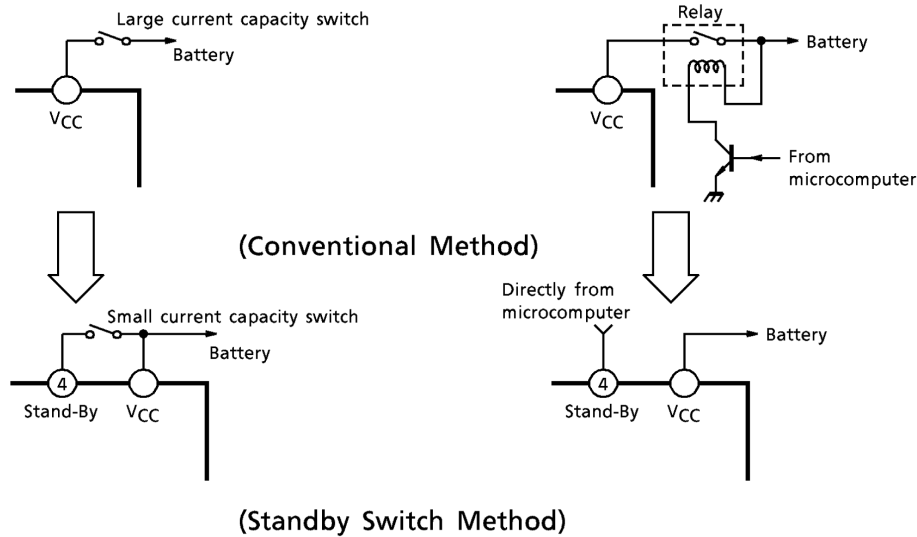

3. Preventive measure against oscillation

For preventing the oscillation, it is advisable to use C_4, the condenser of polyester film having small characteristic fluctuation of the temperture and the frequency.
The resistance R to be series applied to C_4 is effective for phase correction of high frequency, and improves the oscillation allowance.
Since the oscillation allowance is varied according to the causes described below, perform the temperature test to check the oscillation allowance.
      (1)   Voltage gain to be used (G_V setting)
      (2)   Capacity value of condenser
      (3)   Kind of condenser
      (4)   Layout of printed board
In case of its use with the voltage gain G_V reduced or with the feedback amount increased, care must be taken because the phase–inversion is caused by the high frequency resulting in making the oscillation liable generated.

4. Input offset prevention circuit at $V_{CC} \rightarrow$ ON

Having Pre–Amp (Amp1) mounted on the primary stage, this IC contains the circuit for making the Amp1 input voltage and the NF terminal voltage equipotential.
Therefore, the offset voltage produced at the input stage is suppressed to prevent the pop noise at $V_{CC} \rightarrow$ ON. The capacity values of the input and NF condense (C_1 and C_2) shall be set according to the gain to be used.

(Reference) (A) at $G_V = 50$dB ($R_f = 0\Omega$) : $C_1 = 4.7\mu$F, $C_2 = 47\mu$F
            (B) at $G_V = 40$dB ($R_f = 470\Omega$) : $C_1 = 3.3\mu$F, $C_2 = 33\mu$F

5. Muting function

Through setting pin (1) (mute terminal) at about 1V or less, muting becomes possible.
The interval circuit of IC is shown in Fig.4.
When pin (1) is set to low, Q1 and Q2 are turned on, the charge of the ripple condenser is discharged and the bias is cut. The mute amount of 60dB or over can be obtained.
Since this muting function rapidly discharges the charge of the ripple filter capacitor of pin (8), the pop noise is generated by the DC fluctuation of the bias section.
Therefore, this muting function is not appropriate to the audio muting but is effective in muting at $V_{CC} \rightarrow$ on.

R1, R3 = 1kΩ
R2 = 10kΩ

6. External part list and description

Symbol	Recommended Value	Feature	Influence		Remarks
			Smaller Than Recommended Value	Larger Than Recommended Value	
C_1	4.7μF	DC blocking	Related to pop noise at $V_{CC} \rightarrow$ on.		Related to gain. Refer to item 4.
C_2	47μF	Feedback condenser	Related to pop noise at $V_{CC} \rightarrow$ on.		—
			Determination of low cut−off frequency. $C_2 = \dfrac{1}{2\pi f_L \cdot R_f}$		
C_3	220μF	Ripple reduction	Time constant is small at $V_{CC} \rightarrow$ on or off.	Time constant is large at $V_{CC} \rightarrow$ on or off.	—
C_4	0.12μF	Oscillation prevention	Made liable to oscillate.	Oscillation allowance improved.	Refer to item 3.
C_5	1000μF	Ripple filter	For filtering power supply hum and ripple. Large at using AC rectified power supply. Small at using DC power supply.		—

Maximum Ratings (Ta = 25°C)

| Characteristic	Symbol	Rating	Unit
Peak supply voltage (0.2s)	V_{CC} surge	50	V
DC supply voltage	V_{CC} DC	25	V
